Web Applications Kickstart
Make sure your analyses have impact

After spending days or weeks working to understand your data or to build a model, are you able to make sure your entire organization can make use of all your insights and results? Even if you don't consider yourself a developer and certainly not a frontend engineer or JavaScript/HTML/CSS expert, open-source tools like Panel make it simple to build a live, Python-backed web application. That way everyone can discover all the amazing things you saw in the data you analyzed, and they can try out what your model does for all the scenarios and data that they care about.

In this project, we take your "it works fine for me" data analysis and turn it into a live application that works for everyone, showing you how to apply the same process to all of your colleagues' workflows as well, using fully open-source libraries that can become an integral part of how you do your job. See examples.holoviz.org and panel.holoviz.org/gallery for some of our past public projects and examples of the sorts of applications we can build for you. Then just give us a few notebooks, scripts, or existing visualizations, describe your goals, and we will build a live web application to ensure your work makes an impact. In approximately **100 billable hours**, we deliver a complete open-source web application ready to share with colleagues and adapt to your future work.

Requirements
To qualify for this Kickstart project, you must provide the following:

Notebooks, scripts, or other examples of your current analysis workflow

A list of key parameters and input variables

Data used in the analyses (obfuscated if necessary)

Turn your data & models into a company-wide resource with a set of three deliverables:

Notebooks or dashboard apps for interacting with your data

Final report with documentation for usage and future development

A live demonstration and basic training
