

Workflow Integration Kickstart

Unlock the power of Anaconda tools

Getting the most out of any product requires making sure it is fully integrated into your workflows. Our highly experienced engineers will help you connect any Anaconda product into your internal systems, using open-source libraries that can become an integral part of your future workflows. We can work with products from any Anaconda partner, including Microsoft (e.g. Azure and Github), Amazon, Domino, Dremio, Nvidia (CUDA/RAPIDS), Databricks, and Snowflake®, along with many different open-source tools like Nebari, JupyterLab, MySQL, DuckDB, and Postgres. Just give us access to (and documentation for) the systems involved along with descriptions of your goals, and we will put together example scripts, scheduled jobs, and configuration to make sure you can make use of Anaconda packages and tools where they can make a difference. In approximately **100 billable hours**, we deliver easy ways of working with Anaconda tools in your systems.

Requirements

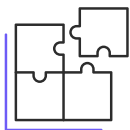

To qualify for this Kickstart project, you must provide the following:

License for the Anaconda product to be integrated

Access to the target system (or a way to replicate it on our servers)

Description of the desired type of integration

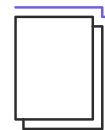

Approval of feasibility from the Anaconda Director of Professional Services

Integrate your activities with a set of three deliverables:

Configuration files, scripts, and other setup needed for integration

Final report with documentation for usage and future development

A live demonstration and basic training

Interested in partnering with our Professional Services team to achieve your business goals?
